

# CHG50/55 PNG Charger

The MP50 is powered by an internal rechargeable battery. For recharging AXNES offers two different charger types. Both chargers are cradle type chargers, one table charger for off aircraft use, the other for airborne use.

**CHG50 Standard table charger:**

The table charger has no retaining clamp and may be supplied stand alone or chained to supply multiple simultaneous charging positions.

When chained 4 charging positions are mounted together and prewired to allow for several MP50's to be charged through a single power supply.

A chained table charger will support individual charge cycles for each MP50.

The table chargers are supplied with a universal power supply for 100 to 250VAC, 50 or 60Hz, and power cords for any national standard.

**CHG55 Airborne use charger:**

The airborne type charger is fitted with an easy to operate retaining clamp which ensures the transceiver is secured when in the charger during flight.

Installed in the aircraft the charger will be supplied by the aircraft DC power. The airborne charger accepts a wide voltage supply range, from 10 to 36VDC through a MIL spec connector.

**Part Numbers and Variants:**

Charger	AXS-CHG-0100	Standard Charger
	AXS-CHG-0150-N	Airborne Charger, NVG
